# The Electric EcoFogao

Dan Mastbergen Dr. Bryan Willson Sachin Joshi

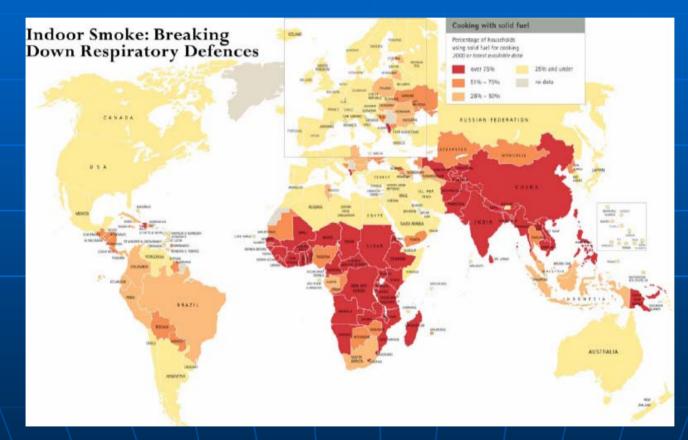

Colorado State University

Rogerio Miranda

Winrock International

#### The Problem

#### 2.4 Billion people use biomass for cooking and heating

#### 1.6 Billion people have no access to electricity

#### The Problem

- Most people using stoves do not have modern lighting
- Using . . . .
  Light from open fire
  Burning sticks
- Kerosene Lantern

#### The Solution

- Most stoves generate a very large amount of thermal energy ~ 1-5 kW
- Much of this energy goes right out the chimney
- Our goal was to create a device to turn a small fraction of this energy into electricity
- The most promising design is a thermoelectric generator (TEG)

## **Lighting Options**

- Candle → 12 Lumen
- Kerosene Wick Lantern  $\rightarrow$  40 Lumens
- 1 W LED → 40 Lumens
- 3 W Cold Cathode Fluorescent Light (CCFL) → 120 Lumens
- 13 W Compact Fluorescent (CFL) → 800 Lumens
- 60 W Incandescent → 730 Lumens

#### **Thermoelectric Generator**

- Develop a Thermoelectric generator to convert waste heat to light
- Thermal energy is converted into electricity by the Seebeck effect

#### **Thermoelectric Generator**

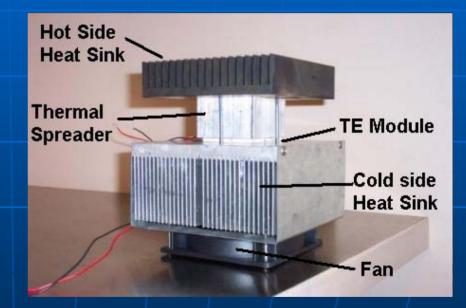

#### Consists of

• Thermoelectric Module

•Cooling Fan

•Hot heat Sink

•Cold heat sink

#### The Ecoforno Stove

The TEG was incorporated onto the Ecoforno Stove

The goal was to produce enough energy to run a 15W compact fluorescent light for 3 hours

45 W-hrs per day

15 W-hrs per meal

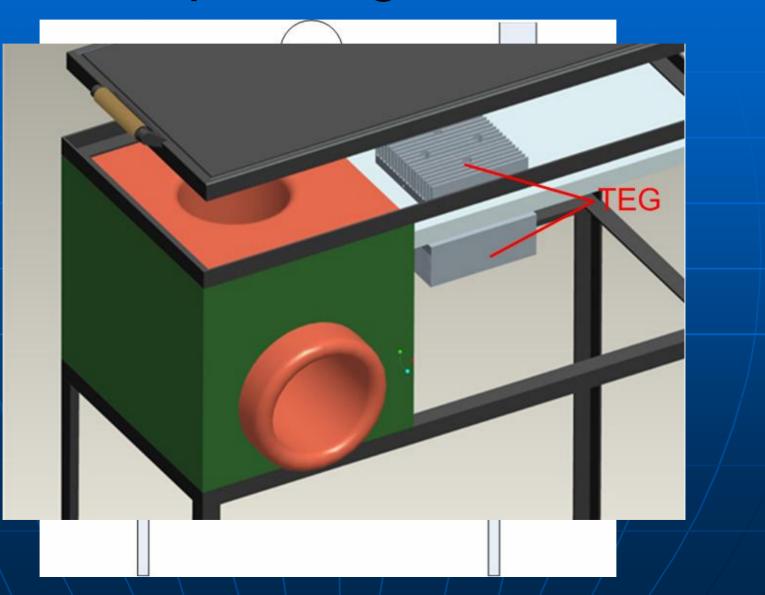

#### Incorporating the TEG

- Initial chimney located TEG
- Produced just over 1 W
- Temperatures were too low (150 – 200 C)
- Need (300 400 C)

## Incorporating the TEG

#### Modifying stove for TEG

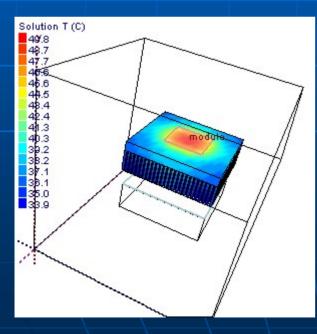

#### Ecoforno with oven removed

#### Reconstructed for use with TEG

#### TEG Design – Module and Heat Sink Selection

•Heat sinks were modeled using a heat sink modeling software program

Various heat sink – module combinations were modeled in a spreadsheet

#### **Heat Sink Selection**

The following heat sinks were identified as candidates

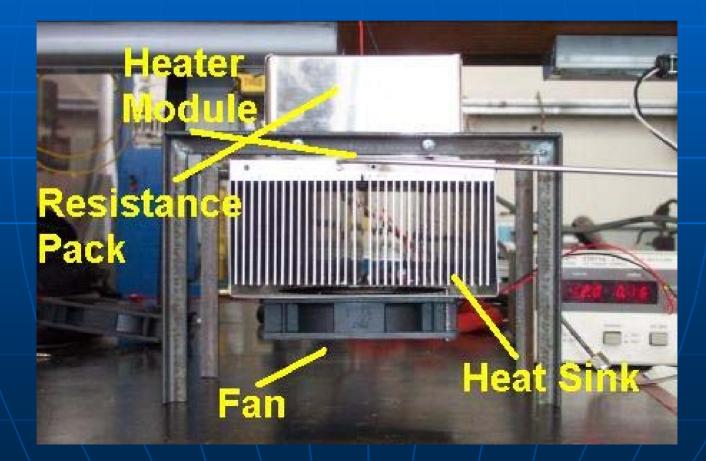

**Bonded Fin Heat Sink** 

**Pin Fin Heat Sink** 

**Extruded Heat Sink** 

#### **Bench Top Testing**

Heat sink thermal resistance and Module power were determined from a series of bench top tests

### **Preliminary Testing**

Preliminary testing was performed to asses:

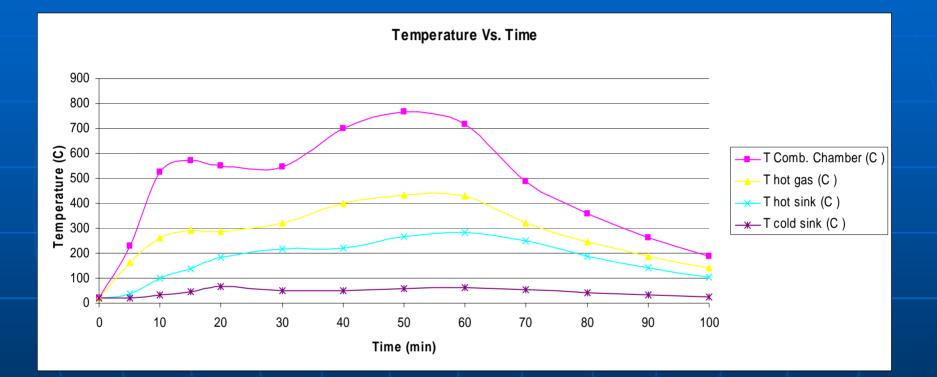

Generator power

• Stove Temperatures

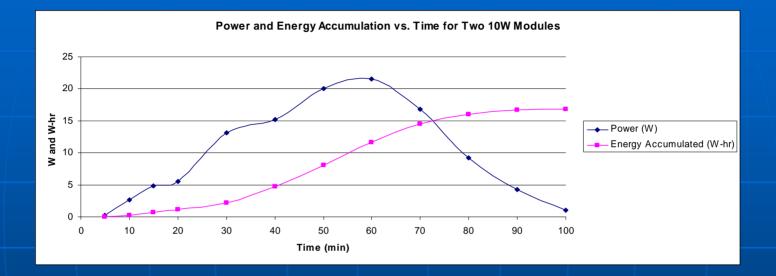

Transient behavior

#### **Stove and Generator Temperatures**

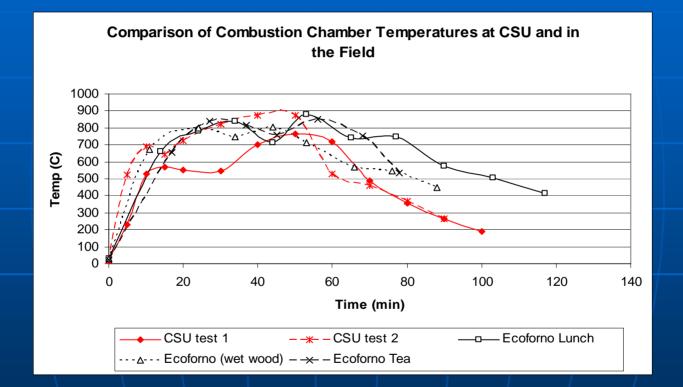

### **Preliminary Test Results**

 17 W-hr per meal with 3 meals per day generates 51 W-hr of energy per day
 Desired amount: 45 W-hr

Stove set-up with two 10-Watt modules produce enough energy to power a 15-Watt CFL for 3 hours

### CSU vs. Field Testing

 CSU testing followed similar path as onsite field testing

#### **Electrical Power Management**

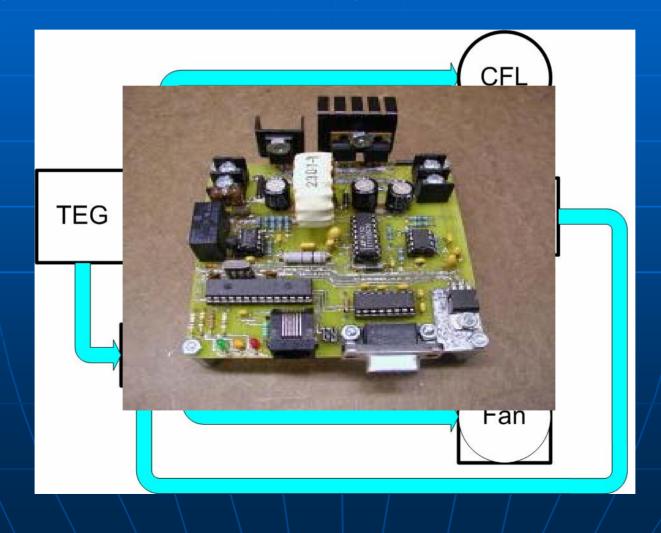

Needs to boost voltage to charge 12 V battery

Needs to regulate charging and discharging of battery

Needs to turn DC-DC converter and fan on and off

#### **Electrical Power Management**

The power circuit is still in development, estimated cost is \$15

### **Total System Cost**

#### In quantities of 1000, TEG system cost is $170 \rightarrow 20W$

\$7.75/watt

In larger quantities, local manufacturing ~ \$5-6/W

Solar power \$5-8/watt

The next generation of thermoelectric modules will reach 3-4 times the power output of current modules  $\rightarrow$ \$2/watt

| Item                                   | Quanity | Cost per item<br>(@ 1000 units) | Cost<br>total |
|--|---------|---------------------------------|---------------|
| Hot heat sink (Thermaflo)              | 2       | \$7.00                          | \$14.00       |
| Cold heat sink (Thermaflo)             | 2       | \$20.00                         | \$40.00       |
| Module (Thermonamic)                   | 2       | \$35.00                         | \$70.00       |
| Thermal spreader                       | 2       | \$3.00                          | \$6.00        |
| Battery (Power Sonic)                  | 1       | \$6.00                          | \$6.00        |
| Fan (Vantec)                           | 2       | \$10.00                         | \$20.00       |
| Power Circuit (Maxim, Mouser)          | 1       | \$15.00                         | \$15.00       |
| TEG System Cost                        |         |                                 | \$171.00      |
|  |         |                                 |               |
| Cost per Watt @ 24 W                   |         |                                 | \$7.13        |
|  |         |                                 |               |
| Stove Cost                             | 1       | \$100                           | \$100         |
| Total Cost for TEG system and<br>Stove |         |                                 | \$271         |

#### Conclusion

- A thermoelectric generator has been successfully incorporated into the Ecoforno stove
- In order to generate the power desired the TEG must be incorporated into the stove design
- The generator produces enough power to run a 15 watt CFL for three hours
- The system cost for 1000 units is \$170 → \$7.75/watt
- Costs will be further reduced through high volume/local manufacturing

#### Future Work

- Complete construction of power management circuit
- Develop a standardized test cycle
- Hot side heat sink redesign (less restrictive)
- Continue to incorporate the latest technology in modules, manufacturing, and electronics to reduce cost
- Field Testing reliability, user interation, etc.
